**Employment Hysteresis from the Increased Pensionable Age: Evidence from Japan**

*(with Saisawat Samutpradit)*

**Abstract:** This paper examines the impact of raising the pension eligibility age on retirement decisions. Using Japanese municipality tax records, we show that increasing the eligibility age for Earnings-Related Benefits (ERB) from 60 to 61 raised employment by 4–6 percentage points, with effects persisting beyond age 61 – a novel finding in this literature. We find no evidence that this employment persistence reflects attempts to offset pension income losses. Instead, it reflects behavioral responses combined with institutional features of the Japanese labor market, where workers generally re-sign contracts at age 60 and firms offer re-employment until 65, often under altered conditions. Heterogeneity by pre-60 income reveals distinct mechanisms. Lower earners typically stayed with their employers, accepting the re-employment contracts, while higher earners were more likely to remain employed in a lower earning jobs after age 60, suggesting experimentation from new employment arrangements. Overall, firm practices and labor market institutions jointly shape responses to the pension reform.
